

Safety in ESD and ATEX environments

Your trusted compounding partner in innovating new material solutions for the most demanding material needs. Our mission is to improve safety in ESD and ATEX environments.

PREMIX

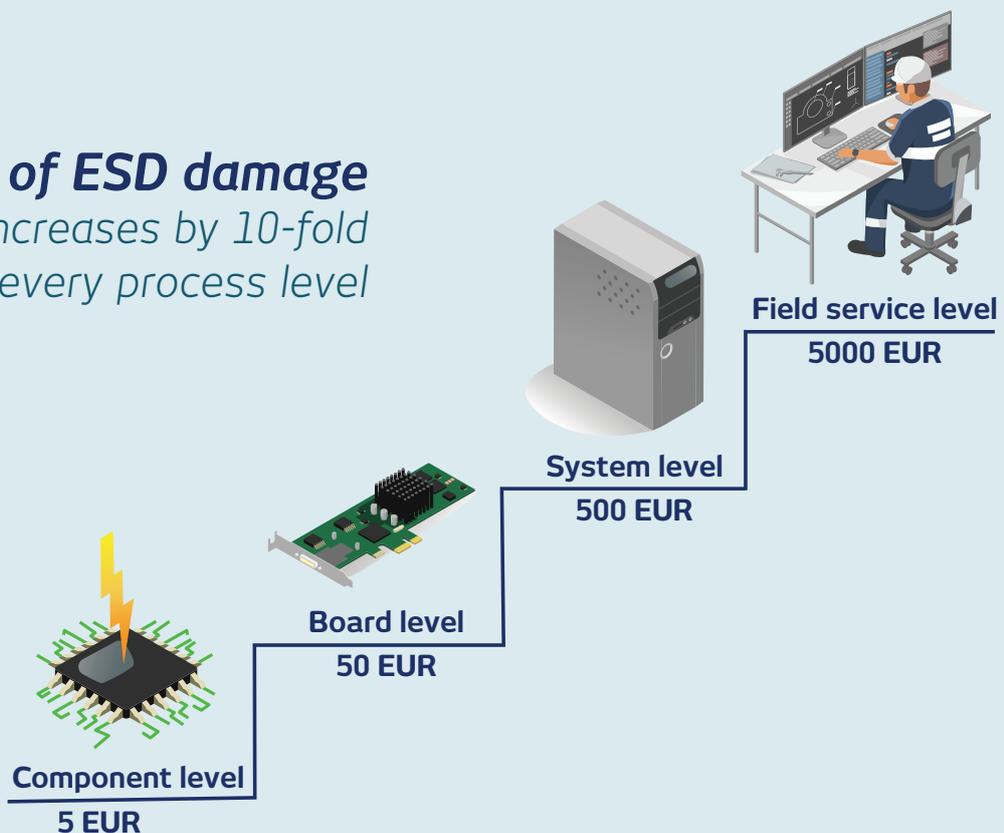

Protection against uncontrolled electric discharge (ESD)

Uncontrolled electric discharge (ESD) appears when a person or object is charged because of static electricity e.g. from rubber shoe soles on a carpet.

In electronics industry, ESD is a recognized problem, as even very mild electric shocks that a person might not even notice, can cause breakages. Electronics have become smaller over time, and the small parts are even more sensitive to ESD. Fragile electronics can break in manufacturing, transportation, or storage, causing enormous losses. To prevent breakage, components can be packaged in ESD-compatible packaging.

Cost of ESD damage
*increases by 10-fold
at every process level*

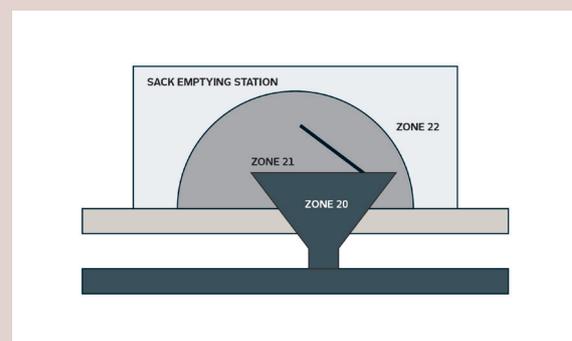

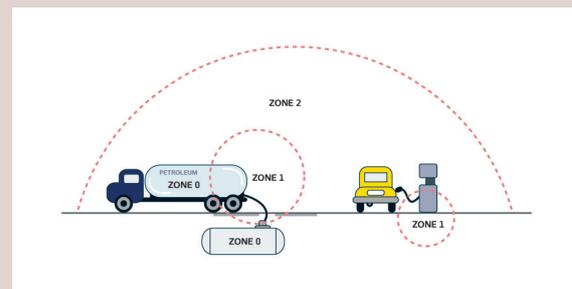

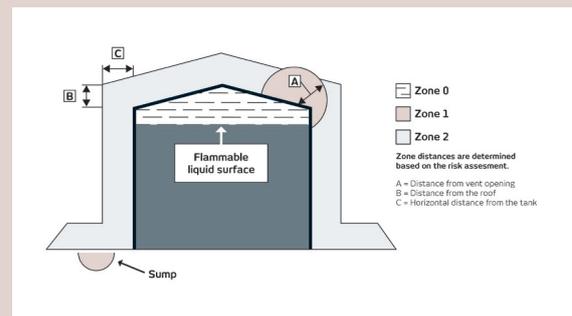

Protection in explosive environments (EX/ATEX)

In explosive (Ex) environments, electric sparks are especially dangerous. Explosions can occur when these factors combine:

- Dry air
- Explosive substances in the air, such as
 - Oil fumes, gasses
 - Dust from agricultural products, such as flour, sugar, cereals, soybeans, rice, etc.
 - Eliminate the effect of static electricity
- Ignition source (e.g., ESD)

European Union's ATEX Directive (2014/34/EU) covers equipment and protective systems intended for use in potentially explosive atmospheres. For raw materials, there's no specific directive, but the materials need to be compatible with the requirements for the whole equipment.

Plastics can be a source of electric discharge if the resistance of the material is over 10^9 – 10^{12} ohms. Using that kind of plastics in equipment might cause dangerous explosions in ATEX environments.

Atex Zone: a place in which an explosive atmosphere is	Gas	Dust
Continually present	0	20
Likely to occur in normal operation occasionally	1	21
Not likely to occur in normal operation and only for very short durations	2	22

*ATEX zones
for gases
and dusts*

Surface resistance - how to read: for example, 2E+6 Ω = 2,000,000 Ω

Carbon black concentrates are an excellent way to reduce the raw material costs. In PRE-ELEC® concentrates, the carbon black content has been optimized to the highest possible level. In sustainable and/or cost-driven applications, regrid or recycled plastics can be used for dilution. Besides the economical advantages concentrates also allow the modification of product properties e.g. stiffness or flame retardancy.

ESD and ATEX applications for PRE-ELEC® materials

PRE-ELEC® sheet materials

for protecting electric components with ESD packaging

The high material requirements of the transport and packaging industry inspire us to continuously develop new sustainable and functional materials to meet the needs of our customers.

PRE-ELEC® film materials

for controlling static electricity with conductive films.

The film compounds have high and durable conductivity and excellent dispersion. We have ensured they are compatible with ATEX regulations and are easy to process. They are also recyclable and resist wear and tear very well.

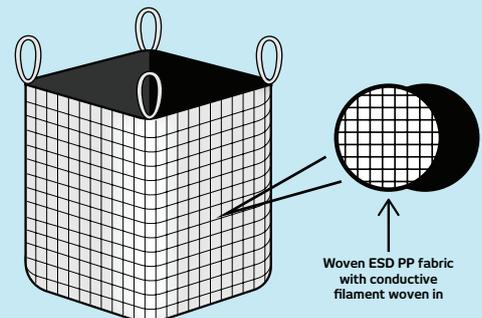

PRE-ELEC® materials for ESD boxes & pallets

used during assembly and transportation

The conductive thermoplastics can be used to eliminate static charging and reduce the risks of explosions in hazardous environments and damaging expensive equipment.

PRE-ELEC® FIBC materials

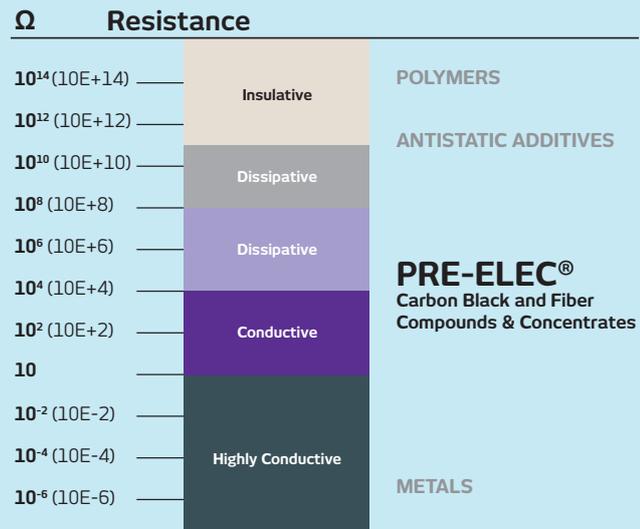

Conductive FIBCs, or FIBC type C bags, are made from non-conductive fabrics interwoven with conducting threads. They can be used to transport flammable powders and in spaces where flammable vapors, gases, or combustible dusts are present. The conductive inner lining increases the safety of these products.

PRE-ELEC® electrically conductive plastics

Premix's electrically conductive PRE-ELEC® plastics typically have much lower resistance than typical plastics, and they can be customized to fulfill the customer's specifications. Compared to metals, plastics are cheaper, lighter, and corrosion-resistant. The plastics can even be made flame-retardant.

Carbon black has established its position as the most widely used electrically conductive filler. Carbon black offers a superior price-performance ratio and stable properties over time. Typically carbon black compounds' surface resistance range settles between $10^2 \Omega$ and $10^5 \Omega$. Premix's comprehensive product portfolio covers the conductive plastics spectrum.

*Precision, purity,
and consistency
– the cornerstones of
PRE-ELEC® compounds.*

We are ready
to create a new
success story
with you!

BOOST YOUR BUSINESS WITH ELECTRICALLY CONDUCTIVE CONCENTRATES

Concentrates help reduce raw material costs. In PRE-ELEC® concentrates, the carbon black content has been optimized to the highest possible level. When striving for maximum cost efficiency, recycled plastics or regrind from your own process can be used to dilute the concentrate. One small yet innovative step can lead to significant cost savings.

Besides the economic advantages, concentrates also allow the modification of product properties. To impart stiffness and strength to the finished product, the reinforced plastic can be used for dilution.

ABOUT PREMIX

With more than 40 years of industry experience, Premix's expertise lies in the formulation and production of functional plastic materials. Premix's materials are more than just traditional plastics – they play an active role in the product or process they are integrated into. Premix was one of the first companies to enter the market for electrically conductive plastics in the early stages, and it is now the world's leading specialist in the area. Today, we are a company that develops future solutions also for antimicrobial materials.

PRE-ELEC® is a registered trademark of Premix Oy.
